

SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: Dmitry Brant Examiner #: 80189 Date: 7/19/04
 Art Unit: 2655 Phone Number 305-8954 Serial Number: 09774925
 Location: 3C16 Results Format Preferred (circle): ☒ PAPER ☒ DISK ☐ E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

 Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Wearable Display System with Indicators of Speakers
 Inventors (please provide full names): Sara H. Basson, Dimitri Kanevsky

Earliest Priority Filing Date: ~~01/31/01~~ 01/31/01

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

Wearable Display system for deaf/disabled people. System locates the speaker in the room and uses ^{visual} indicators to identify the current speaker to the ^{user} wearer of the system. System locates ^{the} speakers using either video camera and/or microphone array.

STAFF USE ONLY

Voice-activated 'Max' developed to aid disabled

Lachenauer, Karen

Cincinnati Business Courier (Cincinnati, OH, US), V16 N9 p37

PUBL DATE: 990625

WORD COUNT: 607

DATELINE: Shreve, OH, US, North Central

TEXT:

Multimedia Max, an "environmental control system" for the disabled that was developed in Tampa Bay, Fla., is going national. Apt Technologies in Shreve, Ohio, has struck an agreement with Max's producer, Multimedia Designs, to market the system that the paralyzed and other handicapped people can talk to so as to control appliances in their homes.

Max uses speech recognition software to allow owners to tell it to turn on the VCR, close the drapes, turn down the thermostat and dictate and fax letters, among other things.

It can also be programmed to tease. In demonstrations, Max has startled and then tickled many a customer when a demonstrator introduces the customer to Max, saying, "This is the person I was telling you about" - and Max bursts out laughing.

Larry Shirer, president of Apt Technologies, located in north central Ohio between Wooster and Mansfield, said voice-activated systems are the wave of the future. He expects Max to take the company further in reaching a potential market of 1 million people in the United States paralyzed by spinal cord injuries and disease.

The system costs \$8,000 including a computer and last year grossed \$135,000 for Multimedia Designs, with a projected \$200,000 this year, said owner Dan Deignan. He also said that figure could be higher if Apt's planned trade-journal marketing takes off more than expected.

At the same time, Deignan is trying to telescale down the bulkiness - and expense - of a groundbreaking eyeglass device.

Potentially, the **glasses** -- called the **Personal Captioning System** -- could allow the deaf to pull sounds out of the air and convert them to text in front of their eyes.

One day, the innovator hopes, people will know from "PCS" emblems at theaters and city council chambers that captioning is available there.

Deignan is a one-man band: the sole staff of Multimedia Designs, otherwise known as MDi. But he is partnering with others across the country to get some of his ideas for the disabled across.

"Dan needs to be commended," said Rick Offner, director of research at the National Captioning Institute, a nonprofit company in Washington, D.C., that puts captions for the deaf on videotapes.

Offner said Deignan is raising awareness of handicapped people's need for technology.

Deignan - who considers himself more of a systems integrator than an

inventor, bringing together machines and software already there to create new uses - is not the first to develop the glasses.

He is working with Murray Fischer of Morton Grove, Ill., an educator whom he said put together a primitive version of the glasses for a deaf student years ago.

The National Captioning Institute has commissioned a northeastern company to work on similar glasses, and MicroOptical Corp. in Boston made the glasses Deignan is trying to promote for civilian use.

Right now, their price tag is about \$5,000 and there is only one pair that they let Deignan borrow for demonstrations.

But the original impetus for the technology was the military, which wanted its people, such as pilots, to be able to read information while still looking at the task at hand, Offner said.

As proof that the military hardware is viable, especially among the inventive types, students are walking around with mini-computers projecting read-outs onto such glasses at the Massachusetts Institute of Technology, Offner said.

The various companies are working together to make the technology smaller so it can be mass-produced. The hope is that the movie industry will pick up on the glasses and lend them or rent them to moviegoers for, say, \$1 a use. Users could then see the movie's dialogue, somewhat like a personal closed-captioning system.

Innovator partners to develop devices for disabled

Lachenauer, Karen

Tampa Bay Business Journal (Tampa, FL, US), V19 N9 p32

PUBL DATE: 990226

WORD COUNT: 637

DATELINE: Palm Harbor, FL, US, South Atlantic

TEXT:

Multimedia Max, an "environmental control system" for the disabled that was developed locally, is going national.

Apt Technologies in Ohio has struck an agreement with Max's producer, Multimedia Designs in Palm Harbor, to market the system that the paralyzed and other handicapped people can talk to so as to control appliances in their homes.

Max uses speech recognition software to allow owners to tell it to turn on the VCR, close the drapes, turn down the thermostat and dictate and fax letters, among other things.

It can also be programmed to tease. In demonstrations, Max has startled and then tickled many a customer when a demonstrator introduces the customer to Max, saying, "This is the person I was telling you about" - and Max bursts out laughing.

Larry Shirer, president of Apt Technologies in Shreve, Ohio, said

voice-activated systems are the wave of the future. He expects Max to take the company further in reaching a potential market of 1 million people in the United States paralyzed by spinal cord injuries and disease.

The system costs \$8,000 including a computer and last year grossed \$135,000 for Multimedia Designs, with a projected \$200,000 this year, said owner Dan Deignan said - a figure that could be higher if Apt's planned trade journal marketing takes off more than expected.

At the same time, Deignan is trying to telescale down the bulkiness - and expense- of a groundbreaking eyeglass device.

Potentially, the **glasses** --called the **Personal Captioning System** - could allow the deaf to pull sounds out of the air and convert them to text in front of their eyes.

One day, the innovator hopes, people will know from "PCS" emblems at theaters and city council chambers that captioning is available there.

Deignan is a one-man band: the sole staff of Multimedia Designs, otherwise known as MDi. But he is partnering with others across the country to get some of his ideas for the disabled across.

"Dan needs to be commended," said Rick Offner, director of research at the National Captioning Institute, a nonprofit company in Washington, D.C., that puts captions for the deaf on videotapes. Offner said Deignan is raising awareness of handicapped people's need for technology.

Deignan-who considers himself more of a systems integrator than an inventor, bringing together machines and software already there to create new uses - is not the first to develop the glasses.

He is working with Murray Fischer of Morton Grove, III., an educator who he says put together a primitive version of the glasses for a deaf student years ago.

The National Captioning Institute has commissioned a northeastern company to work on similar glasses, and MicroOptical Corp. in Boston made the glasses Deignan is trying to promote for civilian use. Right now, their price tag is about \$5,000, and there is only one pair which they let Deignan borrow for demonstrations.

But the original impetus for the technology was the military, which wanted its people, such as pilots, to be able to read information while still looking at the task at hand, Offner said.

As proof that the military hardware is viable, especially among the inventive type, students are walking around with minicomputers projecting read-outs onto such glasses at the Massachusetts Institute of Technology, Offner said.

The various companies are working together to make the technology smaller so it can be mass-produced. The hope is that the movie industry will pick up on the glasses and lend them or rent them to moviegoers for, say, \$1 a use.

Deignan said that, amazingly, there are the few who even before it has become available are complaining.

Deignan said he has received e-mail messages pleading, "Don't make me wear these stupid glasses, it's hard enough being deaf." But most people are telling him they want the technology and they want the technology now,

he said.

IBM EEs improve PC access for disabled

Terry Costlow

ELECTRONIC ENGINEERING TIMES, 2000, n 1097, PG161

PUBLICATION DATE: 000124

JOURNAL CODE: EET LANGUAGE: English

SECTION HEADING: Times People

TEXT:

Advances in interfaces have made it simpler for nearly everyone to use computers over the past several years, and the disabled have benefited from many of the developments. Efforts to make computers and the Internet even more accessible are continuing, helping the handicapped in both their personal lives and the workplace.

In all kinds of research programs within the many operations of IBM, engineers try to figure out how to make computers accessible for those who can't use the interfaces that are already out there. As prices come down on products like PC-oriented cameras, they can be melded with software to create cost-effective data-entry subsystems.

"One of our researchers, Rick Kjeldsen, has developed a suite of tools," said Peter Fairweather, senior manager at IBM's Accessibility Research Institute (Yorktown Heights, N.Y.). "One of them has recently come out through Edmark, an IBM company."

The tools "use computer vision to build an interface for a person without the means to communicate with the computer," he said. "It replaces the switch systems used by many people."

A cerebral palsy victim now might push a button with his head, for example. With the new IBM system, a camera follows small movements, so the user's tender forehead isn't continually pressing the button.

"If you can only move your head and can't speak, you've got to have some sort of typing device," Fairweather said. "We've set up a device so when you move your head in one direction and then back, it will tab to the position you want. Then you move your head to another position to say, yes, that's my choice. That's much better than using a mechanical device, which is awkward, gets out of adjustment and actually hurts after a while."

This system follows the widespread acceptance of screen readers, which let those with visual impairments interact with a graphical user interface. Other data entry systems like speech recognition let others benefit from the explosion in digital technologies.

Now that these technologies have become commonplace for those who need them, IBM is altering the focus of its Special Needs group. In the past, Big Blue has spoken mostly to those with various disabilities. That's a necessity, but the disabled are also a fairly obvious target. Now that those efforts have reached something of a critical mass, the strategy is addressing a group that can provide some big benefits for the disabled.

"One of the things we've switched a bit, after we looked at where IBM's strengths lie, was with our new site and new ad campaign. Now, we're focusing on human-resource executives," said Paul Snayd, program director at IBM Somers (Somers, N.Y.). "Many of them are not aware of the

technology that's there. If they realize there are solutions there, and people with vast amounts of talent, it will help everyone. HR managers will be less reluctant; they'll be more active hiring people with disabilities."

Late last year, IBM's Special Needs Group set up a new Web site: www.ibm.com/able. It's designed to show HR managers what's available, in hopes that they will be increasingly willing to hire the handicapped as they see more and more of them on the job.

Though HR managers are often crying for employees, observers suggest, some find it easier to shy away from the disabled, partly out of fear of the unknown. One concern has been the cost of providing pricey equipment. Screen readers that tell the visually impaired what's on their display, for example, used to cost more than \$1,000. But it's no longer necessary to spend as much on the interface system as on the computer itself.

"In general, to accommodate a person with disabilities is not expensive," said John Steger, program manager at IBM's Watson Research Center (Yorktown Heights, N.Y.). "Screen readers are only \$200 to \$500. We want HR people to know this."

While saying that some HR managers are reluctant to hire disabled workers, the IBM managers note that those who understand the benefits of hiring them don't really look at the disabled differently than they do other job candidates.

"I don't think HR managers look at the disabled as a way to hire cheaper employees," Snayd said. "We just went through some bidding for a researcher, and one of the top offers went to a gent who had just gotten his Ph.D. He is a blind individual."

The Internet is one of the mainstays of this new marketing thrust, raising other issues. The disabled must be able to navigate in the cyber world, which is using more and more graphics and sounds, and that problem will only get worse.

"With Internet 2's additional capabilities, there will be new challenges," Steger said. "It will carry a lot of multimedia, and that has to be provided for in a number of fashions. The deaf need to 'hear' the audio and blind people need to know what the image is."

On the upside, many of those involved with the many specifications that make up the Internet 2 are also thinking about accessibility. Companies like Sun Microsystems, which has made accessibility a key aspect of Java, are putting in hooks that make it simpler for accessible products to pull data from Web pages.

"IBM is changing its concept," Steger said. "We're no longer looking strictly at assisted technology. The world is smaller now, and we want to put access in all of IBM's products. We have changed the paradigm to drive the entire corporation to consider access in all of our products."

Quick peripheral adds

He said that will sometimes mean putting in software hooks, while other times it will involve hardware hooks. Providing easy ways to add peripherals that meet the needs of people with various disabilities helps keep costs down without blocking the disabled from adapting a system to

their needs.

"Since this directive became official a few months ago, we've gotten calls from developers asking how they can do this," Snayd said. "They aren't saying they can't do this or it's too expensive; they're asking how they can put in the hooks. We aren't trying to force things where they aren't needed. There isn't any need to put a Braille printer on all devices, but we do need people to put in the hooks to add a Braille printer."

All products targeted

On an internal Website, IBM developers can go through a checklist to make sure they have included the necessary features. The response from across IBM's divisions has been positive enough that Snayd feels it won't be much longer before it's a rare product introduction that isn't accessible to everyone.

"We expect that by August of this year, most of our products will be prepared for this. We want all our products to be accessible at that point," Snayd continued.

As these and other changes emerge, researchers note that they don't benefit only the disabled: While curb cuts help those in wheelchairs to cross streets, they also are a boon to bicyclists and skateboarders. Similarly, interfaces with cameras to watch the user may someday become a common interface technology used by the masses. It's already happened.

"One of the reasons speech recognition was developed was for people who can't use their hands," Snayd said. "Now it's become a mainstream product."

Snayd and Steger noted that other techniques might some day reach the mainstream. IBM researchers are exploring techniques that will make it easier for the handicapped to use computers. "We're looking at gesturing technology, which will allow a person with minimal movement to do things. Rolling their finger down a tiny bit will move the cursor down," Snayd said.

"We're also looking at wearable PCs," Steger said. "When speech recognition is at the point where it does not have to be trained, a deaf person could wear glasses that display the text of what's being said."

One of the keys for these longer-term developments is keeping the customer in mind. Many researchers involved in IBM's projects have disabilities, but even the insight they provide often isn't enough. The development engineers often tap IBM experts in certain technologies for help, and they often turn to the disabled for input on their requirements. As always, they're trying to learn how to create the most effective solutions.

"Our core people are not just technologists," Fairweather said. "We are students of disabilities, students of human behavior. We spend a lot of time working with people who are disabled to make sure we're on the right track. It's not an uncommon mistake for a technologist to think he has the solution. But often we can make a mistake, or sometimes we will overlook the benefit of a technology."

"We have made major strides in the past several years, but there's lots more to come," Snayd said.

Reading the silver screen. (new technology for deaf and hard-of-hearing moviegoers)

Clark, Joe
Technology Review, v97, n5, p18(2)
July, 1994

TEXT:

A decade's worth of legwork and consciousness-raising sparked by deaf and hard-of-hearing viewers brought captioning to all genres of TV programming, from newscasts to music videos. The campaign has been so successful that, by law, decoders to translate closed-caption signals into words visible onscreen are now built into all U.S. TV sets with screens at least 13 inches in diameter.

But if you have a hearing problem and want to watch the latest Hollywood film at your local cinema, you're out of luck. You're forced to wait for the home video to appear, and even then it might not be captioned.

Researchers at the National Center for Accessible Media (NCAM), a research group at WGBH, the Boston public broadcasting station, are fine-tuning several technologies to break the cinematic sound barrier for deaf and hard-of-hearing moviegoers. In late 1992 NCAM launched its Motion Picture Access Project after receiving countless complaints about uncaptioned first-run films.

The easiest solution would be open captioning, which all viewers would see. But conventional wisdom holds that hearing people resent captions. Witness the reluctance of major studios to release subtitled foreign-language films. Captioning for motion pictures has to be as unobtrusive for hearing moviegoers as it is useful for deaf and hard-of-hearing viewers.

Armed with a small grant from the Department of Education, NCAM engineers spent most of 1993 developing prototype movie-captioning systems. They faced a host of practical constraints, says Larry Goldberg, director of NCAM. First, because each device might be used by thousands of people, it would have to be all but unbreakable and impervious to what the rigorously scientific minds at NCAM call "cooties." It must also work virtually anywhere in an auditorium "so you wouldn't have to have a specialized deaf section in the theater," he explains. Finally, it must be readable, comfortable, easy to use, and above all, cheap enough that stingy theater owners would buy it and sticky-fingered moviegoers wouldn't steal it.

A few months of brainstorming resulted in three trial technologies:

- * Virtual Vision glasses: Initially developed as a kind of video Walkman for portable TV-watching, the Virtual Vision system includes an oversized pair of eyeglasses and a small liquid crystal display that sits at the very top of the glasses and faces straight down. Captions are created by a computer and sent to the display through cables that tether the glasses to the seat. Through lenses and a mirror, the captions on the display are reflected onto the eyeglasses so that as the wearer looks at the movie screen, the captions seem to float in midair.

- * A seatback display: This configuration consists of a vacuum-fluorescent display attached to the back of the seat in front of the viewer. The system--familiar from many supermarket cash registers--produces bright green dot-matrix characters that form the caption text by selectively energizing wires treated with a phosphor coating that glows when electrified. Users can adjust the height of the device as they would the head restraint in a car to place it within their visual range, thus avoiding hundreds of double-takes between movie screen and caption display.

* A rearview display: In this setup, a large light-emitting diode (LED) display located at the rear of the theater displays captions in mirror image. The user sees the display reflected in a clear plexiglas panel mounted on an adjustable stalk attached to the arm of his or her seat while simultaneously watching the movie through the glass.

NCAM ran a field test of these technologies at a 65-seat Boston movie house showing *Sleepless in Seattle* and *In the Line of Fire* in October 1993. Audiences included hearing viewers as well as hard-of-hearing and deaf volunteers "because we wanted to see what hearing people would think if they were going to a theater with these devices around them," Goldberg says.

The systems received mixed reviews. When adjusted properly, the Virtual Vision glasses were highly readable and not distracting to other moviegoers. But the glasses need careful setup because they are designed to project virtual captions for a person's dominant eye. Thus, a person would have to know which eye is dominant and request a left or right-eye version, and theater owners would need stocks of each on hand. Moreover, because the glasses are expensive (retailing for \$700 apiece) and contain high-tech components, they're very much worth stealing.

Wearing the 5-ounce glasses through a two-hour movie also took its toll in simple fatigue, particularly for people who already wear glasses. The cables were another annoyance.

The seatback display was bright and readable. But it blinked and flashed when the captions were changed, which distracted hearing viewers seated nearby.

The rearview display was dirt cheap, low-tech, and easy to use, but not as bright or readable as the other options. It was also difficult to keep the plexiglas aimed at the LED display on the rear wall amid the jostling that occurs in a crowded theater. Still, Al Sonnenstrahl, a deaf person who tried each of the captioning systems, seemed most impressed with this option, finding it flexible enough to move to a comfortable viewing angle and both reflective enough to read the captions at the rear of the theater and transparent enough to see through the captions to the screen.

NCAM plans to conduct larger-scale tests on all three options in the next two years, says Goldberg, before deciding which one to release. In the meantime, researchers are working to improve the technologies. Adaptations to Virtual Vision glasses--such as reducing their weight and eliminating their cables--are unlikely given that they would involve sophisticated, and therefore prohibitively costly, components.

NCAM designers hope to make the seatback display less obtrusive by reducing its size, perhaps to the point of making it portable. They also plan to test a grooved coating for the screen that channels the image to a narrower viewing angle, limiting the sideways spill of light from the display.

For the rearview displays, designers hope to use a brighter LED display on the theater's rear wall. They also want to use a stiffer gooseneck stalk to improve the display's stability.

COPYRIGHT 1994 Massachusetts Institute of Technology Alumni
Associatio

...ABSTRACT: Accessible Media (NCAM) are testing several new technologies that promises comfortable viewing to deaf and **hard -of- hearing** movigoers. The new technologies, namely the Virtual Vision **glasses** , seatback **display** and rearview display, were the result of the NCAM researchers' tireless efforts in the past...

...not content, and reinforce main ideas and concepts through rephrasing. Use of technology in this **area** is not well documented. Two programs funded to research assessment and teaching techniques for this...

...due to learning disabilities (Lowry, 1990; Osher & Webb, 1994). An Interagency Committee on Learning Disabilities **identifies** persons of average or above average intelligence who encounter significant difficulties with listening, speaking, reading...

...learning disabilities affect the progress of adults learning English? How can learning disabled adults be **identified** and assessed? What kinds of instructional methods work best with this population? What kind of...

...getting general information about what is said or written through the overall context when specific **words** or concepts are not understood or substituting known **words** for **words** that cause difficulty). However, these strategies may not be available to the learner in the new language (Ganschow & Sparks, 1993; Lowry, 1990).

IDENTIFYING ESL ADULTS WITH LEARNING DISABILITIES

It is difficult to **determine** how many adult ESL learners have learning disabilities. Estimates of the total U.S. adult...

...is not known, however, if this is true in adult ESL classes. The process of **identifying** anyone--adult, child, native English **speaker**, or ESL learner--as learning disabled can be stigmatizing (McCormick, 1991). Therefore, educators stress weighing the advantages of **identifying** adults as learning disabled (making them eligible for special instruction, resources, and services) against the possible stigma of the label (Lowry, 1990).

Before **identifying** an adult as learning disabled, other reasons for lack of expected progress should be considered...

...the change in alphabet from Arabic to English; his slow reading by the change of **direction** in reading.) In fact, some of the problems of learning disabled language learners may be...

...lack of progress in the second language classroom.

ASSESSING THE LEARNER

Using standardized tests to **identify** learning disabilities presents problems: First, instruments designed to diagnose learning disabilities are usually normed on...

...test are not always reliable. Because the concepts and language being tested may have no **direct** translation, the validity of tests translated into the native language is questionable. Second, the tests...

...auditory discrimination exercises assessing the learners ability to distinguish between vowel sounds or between nonsense **words**) may suggest difficulties the learner could experience with sound-related aspects of the language (Ganschow **words** and make concepts accessible through the use of pictures, charts, maps, timelines, and diagrams.

Synthesis method for generating sign language image on video - ...

...speech analysis to extract text used to retrieve sign from database and merge sign with video image of speaker

...Abstract (Basic): The translation system converts speech to video images of sign language for hearing person to deaf person communication. The system has a microphone and camera capturing speech and video of a speaker. The head of the speaker is identified from the video images. The speech input is applied to a speech analyser that outputs text. The system...

...be added to the image of the speaker. The combined images is transmitted to the deaf recipient...

VIDEO CAMERA

ABSTRACT

PROBLEM TO BE SOLVED: To provide a **video** conference system that enables even a **hard -of- hearing** person participate in **video** conference.

SOLUTION: The **video camera** is provided with an imaging means 11, a signal processing circuit 12 that converts an imaging output from the imaging means 11 into standard **video** signal, **microphones** 21L, 21R that collect utterance of a person uttering, a voice recognition circuit 23 that applies voice recognition to output signals from the **microphones** 21L, 21R for providing an output of a corresponding character code, an encoder circuit that superimposes the character code onto the **video** signal to provide an output, a drive mechanism 41 that revises the direction of the ...

... that discriminates the position of the person uttering from the output signal coming from the **microphones** 21L, 21R and gives the discrimination result to the drive mechanism 41. The control circuit...

HEAD MOUNTED **DISPLAY** FOR WATCHING PUBLIC SUBTITLES AND CLOSED CAPTION
TEXT IN MOVIE THEATER

ABSTRACT

PROBLEM TO BE SOLVED: To provide a system for delivering closed caption **text** to attendees of movie theaters or the other events, and to provide a head mounted **display** used for **hearing impaired** persons and persons who do not speak the language used in the conversation in a...
...people in the other events.

SOLUTION: A device formed by a monocular or binocular type **display** suitable for the head mounted **display** put on the movie audience or event participants, a central router/processor, and a transmission protocol are main components. Closed caption **text** or representative **text** is projected on a **display screen** of the **display** in synchronization with the conversation in the movie or broadcast so that the **wearer** can see motion on a **screen** and completely separate from the people not using the **display** device. An interface for selecting language of closed caption **text** is provided for the people speaking a foreign language.

Video conversation and monitoring system with remote function...

...has remote monitoring function and peripheral equipment control function in addition to video -phonic conversation function and is suitable for various user-intended guidance services

...Abstract (Basic): The video conversation and monitoring system has one or more end station terminal systems (3,4) and...

...Each end terminal station terminal system includes a video -phonic conversation unit (10) with one input (12) monitoring the image of a room . A second video input (15) enters the image of a visitor when a conversation is in progress. A video output display produces (11) the image. An audio input unit enters the sound (321), while the audio output (322) outputs it. A video coder/decoder transacts video signals...

...USE/ADVANTAGE - Compact, versatile and simple video conversation and monitoring system capable of performing conversation and monitoring through bidirectional transmission of sounds...

...Abstract (Equivalent): A video conversion/monitoring system in which at least one end station terminal system and one center station terminal system are linked through a communication line which carries video and audio information directly between said end station terminal system and said center station terminal system...

...first video input means for entering a monitoring image of a wide area of a room in which said unit is located ,
...

...second video input means for entering an image of a visitor...

DEVICE FOR GAME PARLOR MONITOR AND GAME PARLOR MONITORING SYSTEM

PUB. NO.: 2002-325958 [JP 2002325958 A]
PUBLISHED: November 12, 2002 (20021112)
INVENTOR(s): TAKIHARA HIROKAZU
APPLICANT(s): HEIWA CORP
APPL. NO.: 2001-136421 [JP 2001136421]
FILED: May 07, 2001 (20010507)

ABSTRACT

...SOLUTION: The game parlor monitoring system has a liquid crystal display section having a small **camera**, a microphone, speakers for the ears and an operating button, and a transmitter and receiver sending an image signal from the small **camera**, a sound signal from the microphone and control information from the operating button and receiving a signal from a monitoring **room** or a hall computer, generating a signal to drive the liquid crystal display and the speakers, and the small **camera** and at least one of the speakers are fixed to the end of a member structured so as to be **mounted** on the **head**, and arranged so as to be located on the right and left of the head...

**Telephone service provision method for hearing impaired , involves
filtering synchronization tone output in response to text message, from
reaching communication assistant and hearing party**

Abstract (Basic):

... Voice message received from a hearing party is converted into a text message by a **communication assistant** (170). A modem (162) converts the text message received from the **communication assistant** into a synchronization tone which is filtered by a filter (190), so that synchronization tone is prevented from reaching the **communication assistant** and the hearing party.

... 3) device for facilitating communication with a **hearing impaired** party...

...For providing telephone services for **hearing impaired** person...

...tones are prevented from reaching the hearing party, without clipping the voice message from the **hearing impaired** person, thus the reliable and accurate conversations between the **hearing impaired** parties, the **communication assistant** and the hearing parties is realized. Frequent re-synchronizing of teletype device is avoided, thus ...

... **communication assistant** (170)

Detailed Description

Detailed Description

... in relation to the visual presentation on the video screen.

Initial attempts to produce home **theater** sound included placing a pair of traditional speakers on either side of a centrally located video **display**. Such systems improved upon the sound of speakers included within the typical television set. However...

...located off the center line between the two speakers will not localize dialog to the **screen** (i.e., perceive the dialog to be solely coming from the **screen**). Dialog is typically recorded equally in both the left and right channels signals. Localization of...

...thefirst arriving signal originates. This will be the closest speaker. Dialog collapses to the near **speaker** as a listener moves off axis - The localization of dialog will be displaced from the **location** of the **video** image for off axis listeners, and the illusion that the characters on **screen** are actually speaking for off axis listeners will be destroyed. Second, a pair of stereo speakers located on either side of the **visual display** confines the sound field to the space in front of the listener, in the plane...

Subfile: A B C

Abstract: Describes the E-Model Pathsounder, a device used by blind and **deaf** -blind people to travel independently. It has the appearance of a transistor radio and is worn or hung around the neck. When an object comes within six feet of the **wearer** the transmitter on the chest of the **wearer** vibrates. When object comes within thirty-two inches, a tiny vibrator on the back of...

... activated and this tells the user not to crash into objects. That vibration is for **deaf** -blind people since blind people need only use the audio **display** , whereby a low buzzing sound emitted at six feet changes to a high beep at thirty-two inches. The vibratory **display** is very strong and easy for **deaf** -blind people to feel on the chest and neck.

Title: Tactile pitch displays for the deaf

Abstract: Poor pitch control decreases the intelligibility of **deaf** speech. Small tactile pitch displays have the potential for supplying

continuous corrective feedback for the improvement of the intonation patterns of **deaf** speakers. A simple pitch detector and tactile **display** proved effective in correcting a common intonation problem, indicating that work toward a **wearable** tactile aid is justified. A hypothesis is presented that explains the cause of the pitch problem and the success of the experimental system in terms of the need of the **deaf** speaker for voicing and frequency referents.

Language: ENGLISH Document Type: ARTICLE (Abstract Available)

Abstract: Lipreading provides a limited amount of information about speech signals to profoundly **deaf** people. Visual displays using peripheral vision as an alternative sensory modality can provide supplementary speech information. The utility of a cosmetically acceptable peripheral vision **display** was explored. A pair of eyeglasses with a commercially available two-dimensional red LED array (5 x 7), and its associated electronics was developed. The **display** is visible only to the **wearer**, and is located in the temporal field and the horizontal meridian of the right eye...

...of providing information about voicing and plosion/frication.

Experiments demonstrate the capability of the peripheral **display** in conveying speech information. Presenting vowel-consonant-vowel syllables, the performance was in excess of...

The 'talking glove': a speaking aid for nonvocal deaf and deaf-blind individuals

ABSTRACT:

A new two-way communication system is being developed to reduce the communication barrier between **hearing** persons and nonvocal **deaf** and **deaf-blind** people. A **deaf** person can 'speak' to a **hearing** person by **wearing** the 'Talking Glove', i.e., an instrumented glove which converts his fingerspelled words into synthesized speech. The **hearing** person replies by typing on a portable pocket keypad. This response is presented to a sighted **deaf** person on an alphanumeric wristwatch **display** or to a **deaf-blind** person on a mechanical braille **display**. The communication system has been tested by several **deaf** and **deaf-blind** individuals with encouraging results.

...a variety of uses in speech data acquisition systems. Applications include teleconferencing, speech recognition and **speaker identification**, sound capture in adverse environments, and biomedical devices for the **hearing impaired**. An array of microphones has a number of advantages over a single-microphone system. It may be electronically aimed to provide a high-quality signal from a desired source **location** while simultaneously attenuating interfering talkers and ambient noise, does not necessitate local **placement** of transducers or encumber the talker with a hand-held or head-mounted microphone, and does not require physical movement to alter its **direction** of reception. Additionally, it has capabilities that a single microphone does not; namely automatic detection, localization, and tracking of active talkers in its receptive **area**. A fundamental requirement of sensor array systems is the ability to **locate** and track a speech source. An accurate fix on the primary talker, as well as...

...any interfering talkers or coherent noise sources, is necessary to effectively steer the array. Source **location** data may also be used for purposes other than beamforming; e.g. aiming a camera in a video-conferencing system. In addition to high accuracy, the **location** estimator must be capable of a high update rate as well as being

computationally non...

...application of source localization algorithms for estimating the position of speech sources in a real **room** environment given limited computational resources. The theoretical foundations of a speech source localization system are...

...the derivation and evaluation of an appropriate time-delay estimator and a novel closed-form **locator**. Finally, results obtained from several real systems are presented to illustrate the effectiveness of the...

Title: Vowel articulation training aid for the deaf

Abstract: The signal processing strategy for a computer-based vowel articulation training aid for the **deaf** is described. This processing is based on a nonlinear/linear artificial neural network transformation of 16-channel filter bank data to a two-dimensional **space** which approximates an F1/F2 **space**. **Speaker** -independent vowel training **displays** have been developed with vowel **identity** cued by spatial **location** and color. Testing with both normally-hearing and hearing-impaired listeners **indicates** that the **display** is very easy to interpret and that the relationship between the pattern and the spoken vowel is consistent. The continuous relationship between phonetic perception and **display** patterns provides feedback for fine tuning of vocal tract settings.

PAGE 1023. 191 PAGES

The benefit to the deaf of real-time captions in a mainstream classroom environment

The goal of this study was to **determine** if real-time captions (RTC) benefit both hearing and **deaf** students and if the format of the **display** has an effect on verbal comprehension. Comprehension was measured with an established working memory test that has been shown to be sensitive to perception difficulty.

For the first experiment, **deaf** and hearing subjects were found to have similar abilities to recall written verbal material. RTC produced improved performance for both groups. Analysis of the RTC conditions **identified** significant effects for hearing type (hearing students performed 9.8% better than **deaf** students) and the number of captioned lines (four lines were 4.3% better than two lines) but not **display location**. The conditions with four lines resulted in better performance than those with two lines, especially...

...found to have an impact only during 3 and 4-way interactions including hearing type (**deaf**, hearing) and the number of lines the captions lagged behind the **speaker**'s voice (0, 1, 2). Performance was seen to improve slightly as sentence lag increased except for **deaf** subjects at 200 wpm. Under the 160 wpm conditions, it was possible to predict performance of the

deaf subjects from the hearing subjects by applying an adjustment factor derived from the first experiment...

...suggested that, under most scenarios, subject preference was correlated with performance. The exception was that **deaf** subjects tended to dislike conditions with sentence lag despite higher performance.

Two aggregate factors, buffer...

...of lines, the rate of presentation, and the sentence lag between the captions and the **speaker** were all found to have an effect. However, **location** did not show an effect.

WAVE COLLATION VISUAL SPEECH DISPLAY (DEAF SPEECH)

Author: MITCHELL, PHILIP ANDREW

Degree: PH.D.

Year: 1992

Corporate Source/Institution: BOSTON COLLEGE (0016)

Source: VOLUME 54/01-B OF DISSERTATION ABSTRACTS INTERNATIONAL.

PAGE 477. 142 PAGES

WAVE COLLATION VISUAL SPEECH DISPLAY (DEAF SPEECH)

The wave collation **display** complements previous research on **deaf** speech reception devices in two ways. First, most research has used the tactile modality; with...

...technology, however, make possible a wide-ranging exploration of alternative speech processing approaches. The collation **display**, as a minimally-processed speech **display**, is a first step in this exploration, providing a baseline against which more sophisticated processing...

...speech, a fixed window is used. This compacting of the waveform reduces such a speech **display** to a manageable size and at the same time, the alignment of successive frames makes...

...contour and formant transitions, more salient than in the original waveform.

Evaluation of the collation **display** included both analytic evaluation and training. Analytic evaluation was based on a perceptual sorting task using untrained subjects. Subjects sorted printed speech **display** tokens by **visual** similarity, both in a free sort and in a sort with fixed exemplars. The salience of speech information in the **display** is measured by the extent to which subjects with no training sort the tokens according...

...speech sound categories. Evaluations were performed for vowels, under varying conditions of token variability (single **speaker**, multiple speakers, multiple phonemic contexts), and for voiceless consonants. A single evaluation of spectrogram tokens, using the **identical** procedure, was performed for comparison. Results ranged from 73% correct (consonants) to 39% correct (multiple **speaker** vowels), all well above chance. Multidimensional scaling was used to interpret the perceptual **space** implied by sorting results.

As a first assessment of learnability of the **display**, four subjects

were trained on the same sorting tasks as above; aftering mastering these tasks...

Title: INITIAL FINDINGS WITH A WEARABLE MULTICHANNEL VIBROTACTILE AID

Abstract: Data are presented on the speech perception performance of two profoundly **hearing - impaired** subjects while using a two-channel vibrotactile aid (Tactaid II) or a new, seven-channel instrument. Both subjects, one a profoundly **hearing - impaired** teenager and one a postlingually **deaf** adult, are experienced users of tactile aids. The data suggest better recognition of speech features, **words**, environmental sounds, and enhancement of lipreading skills with the new multichannel instrument than with the...

Educating Children Who Are **Deaf** or **Hard** of **Hearing** : Auditory-Oral.
ERIC Digest #E551.

...overview of the auditory-oral approach used for developing communication skills in children who are **deaf** or **hard** of **hearing** . The approach is based on the fundamental premise that acquiring competence in spoken language is a realistic goal for children who are **deaf** or **hard** of **hearing** and is best developed in an environment in which spoken communication is used exclusively in...

...the auditory-oral approach that are critical to its success, including parent involvement, appropriate amplification (**hearing** aids or cochlear implants), consistent quality speech training to develop speech production skills, developmentally appropriate language instruction, and a range of placement options; (2) the ability of most children with **hearing** loss to benefit from an auditory-oral approach; (3) the benefits of an auditory-oral...

...in spoken language, both receptively and expressively, is a realistic goal for children who are **deaf** or **hard** of **hearing** . Further, this ability is best developed in an environment in which spoken communication is used...

...needs are evaluated individually and monitored carefully over time with modifications being made as necessary. **Hearing** aids are the first choice; however, for children whose severity of loss limits the success of a **hearing** aid, cochlear implants are a viable option. Given the power and flexibility of current **hearing** aids and the availability of cochlear implants, it is realistic to expect almost every child with a **hearing** loss to hear speech at conversational levels.

Teaching children to use whatever **hearing** they have to further the acquisition of spoken language is basic to the auditory-oral...

...production skills (duration, loudness, pitch, and articulation) requires skilled teachers who work individually with children **wearing** appropriate amplification. Instruction is carried on at two complementary levels: the phonetic (developing proficiency with isolated syllables) and the phonologic (developing proficiency with **words** , phrases, and sentences). Skills are developed at the phonetic level and practiced immediately at the ...

...can choose an auditory-oral option?

Given current amplification technology (i.e., powerful and flexible **hearing** aids, FM systems, cochlear implants), it is reasonable and

realistic to expect most children with **hearing** loss to hear at conversational levels. This makes an auditory-oral education a possibility for...

...year-old levels, which is approximately double the national average for all children who are **deaf** .

What are the limitations of the auditory-oral approach?

As with every approach to educating children who are **deaf** or **hard** of **hearing** , not all children will be successful. Unanswered questions remain about auditory functioning (even some **hearing** children cannot use their **hearing** well), language processing (some children may also have additional language disorders), and learning styles (some...
...from auditory-oral education will diminish. Fortunately, the availability of effective amplification removes severity of **hearing** loss as a limitation of auditory-oral education.

Title: Intelligibility of modified speech for young listeners with normal and impaired hearing

...Abstract: modified speech could be extended to provide intelligibility improvements for children with severe-to-profound **hearing impairment** who **wear** sensory aids. In addition, the separate effects on intelligibility of slowing down and amplifying speech were evaluated. Two groups of listeners were employed: 8 severe-to-profoundly **hearing - impaired** children and 5 children with normal hearing. Four speech-processing conditions were tested: (1) natural...

...slowed and envelope-amplified speech. For each condition, three types of speech materials were used: **words** in sentences, isolated **words** , and syllable contrasts. To degrade the performance of the normal-hearing children, all testing was completed with a noise background. Results from the **hearing - impaired** children showed that all varieties of modified speech yielded either equivalent or poorer intelligibility than unprocessed speech. For **words** in sentences and isolated **words** , the slowing-down of speech had no effect on intelligibility scores whereas envelope amplification, both...

... Intelligibility results from normal-hearing children listening in noise were somewhat similar to those from **hearing - impaired** children. For isolated **words** , the slowing-down of speech had no effect on intelligibility whereas envelope amplification degraded intelligibility...

... on syllable discrimination. In summary, without extensive exposure to the speech processing conditions, children with **impaired hearing** and children with normal hearing listening in noise received no intelligibility advantage from either slowed...

THE DEVELOPMENT OF A SOUTH AFRICAN BIONIC EAR. (AFRIKAANS TEXT)

The bionic ear electrically stimulates the nerve-endings in the auditory system of profoundly **deaf** persons. The object of the stimulation is to elicit a sensation of sound. The bionic ear consists of a set of electrodes, implanted into the cochlea of the **deaf** person, and a externally **wearable** speech processor. The two main functions of the speech processor is to extract parameters important for understanding speech and to code these into a suitable pattern of electrical stimuli. A **deaf** patient, with electrodes implanted in his cochlea, took part as a volunteer in a series...

'It was dangerous. That was the point': In 1993, volcanologist Stanley Williams led 16 people up a Colombian volcano. It erupted and nine of them died. Having survived with terrible injuries, Williams presented himself to the world as a plucky hero, but now he is being blamed for the tragedy. He tells James Meek why it was not his fault

Courting a deaf movie audience with caption devices

ABSTRACT: Three technologies that allow **deaf** people to sit in a theater and see a movie's dialogue in **captions** that do not distract the rest of the audience are being tested. One device uses a monitor attached to the seatback, one uses special video **glasses** and one uses transparent plastic panels.
